

Opportunity Radar — Product Required Document

This is Temi's original PRD with one addition: a monetization section (18), covering the Pay-Per-Event requirement that was wired into the Actor after this PRD was first written. Nothing else has been changed.

18. Monetization (Pay-Per-Event) NEW

The hackathon requires every submitted Actor to be monetized using Apify's Pay-Per-Event (PPE) method — this isn't optional, it's part of the submission spec.

What gets charged: one listing-processed event for every opportunity that completes both the eligibility check and the trust check together. Browsing, loading, and Compare mode never trigger a charge — only a listing that's been fully assessed.

What this means for the frontend/UX:

- No new UI is required for v1. The charge happens Actor-side, between the student submitting their profile and results coming back — it's invisible to the student, the same way Apify's own compute cost already is.
- No "payment" or "checkout" screen is needed. The student isn't paying anything directly — Apify bills whoever calls the Actor (in our case, our own frontend calling it on the student's behalf), same as any other Apify Actor usage.
- Worth keeping in mind for later, not v1: if we ever want to show "this run cost N credits" or similar transparency to the student, that would need a small addition to the results screen. Not required for the hackathon MVP.

The event name and charge logic are already live in the backend code. The price per event is configured separately on Apify's side, not something the frontend needs to know or handle.
